

Lehmann&Voss - Organic Modifiers

Product	Chem. Description	Features and Benefits
LUVOTIX® R	Castor Oil Derivate	Thickener and anti-settling agent for various applications in non-aqueous organic systems. Controls the rheological properties of low and medium polar systems, process temperatures 35 to 55°C. Viscosity increase effect.
LUVOTIX® HP	Polyamide	Very fine micronised thickener and anti-settling agent. For solvent-based and solvent-free medium to high polar liquid organic systems, process temperatures 55 to 65°C.
LUVOTIX® VP031	Polyolefin Stabilized Derivate of Stearic Acid	Thickener and anti-settling agent, very fine micronised, easy activation, highly efficient. Viscosity increase effect, causes thixotropic properties. For solventborne and solventfree formulations, low to medium polar.
LUVOTIX® P 100-15	Polyolefin	Effective anti-settling agent. Controls the rheological properties of medium to high polar solvent-based and solvent-free formulations. Well defined particle size distribution, no significant effect on viscosity increase.
LUVOTIX® P 25 X	Polyolefin/Xylene (25%)	Anti-settling paste without significant viscosity increase effect. For an extended range of polarities and process temperatures. Low to high polar systems, for solvent-based formulations.
